

OBJECT ORIENTED PROGRAMMING LAB  
EXERCISE SET 3

1. Design and implement a Box class with data members modelling the dimensions of a 3D cuboid and methods to compute volume and surface area and comparing two boxes with respect to volume, surface area and dimensions. Also implement a parameterized constructor for the Box class.

2. Design and implement a stack class in Java that captures the behaviour of Stack ADT.

3. Design and implement a queue class in Java that captures the behaviour of Queue ADT.

4. Design and implement a vector class which models a two-dimensional vector with the following methods to manipulate the vector:

- a. sum
- b. difference
- c. norm
- d. dot product
- e. perpendicular
- f. parallel

Use the vector class defined above to implement the following two classes:

- a. Triangle
- b. Rectangle

5. Design and implement a merge sort class.
